Dmytro Lamashevskyi

Senior Software Engineer | .NET, AWS & Applied AI

Kagawa, Japan | d.lamashevskyi@gmail.com | +81 (070) 9273-5332
github.com/DmytroLamashevskyi | dmytrolamashevskyi.github.io

Professional Summary

Senior Software Engineer with 6+ years of commercial experience building backend, distributed, and data-intensive systems. Hands-on background in .NET and AWS, spanning architecture, implementation, production diagnostics, business automation, and legacy modernization. At Honki Mode, reduced selected POS analytical update latency from approximately 1-2 minutes to 10-20 seconds and implemented approximately 300 MB CSV exports with bounded memory use. Applied AI work includes a commercial RAG feasibility prototype and personal projects using Amazon Bedrock and speech AI. Seeking a hands-on senior role with responsibility for architecture and product decisions.

Core Skills

Backend & Architecture: C#, .NET, ASP.NET Core, REST APIs, system integration, distributed systems, microservices, RabbitMQ, Entity Framework / EF Core.
Data & Performance: PostgreSQL, SQL Server, ClickHouse, Redis, MongoDB, query optimization, caching, background processing, analytics workloads.
AWS & Operations: EC2, S3, Lambda, Cognito, CloudWatch, IAM-aware application design, cost optimization, production diagnostics; Kubernetes / EKS familiarity.
Quality & Delivery: xUnit, NUnit, Moq, Selenium, integration and E2E testing, CI/CD, Git, Azure Pipelines, Sentry, Grafana, root-cause analysis.
Additional Breadth: WPF / Windows desktop, React, TypeScript, Python / Django, Docker, AI-enabled systems, AWS Bedrock, MCP.

Professional Experience

AI Solutions Architect & Tech Consultant **Mar 2026 - Present**
Honki Mode (Startup) *Kagawa, Japan*

- Work directly with clients and bridge engineers to clarify operational requirements and build tailored software, with Forward Deployed Engineer responsibilities.
- Built and extended a Python / Qt finance tool that normalizes inconsistent company data and produces payment workbooks; estimated savings are approximately 1-2 person-days per month.
- Designed a custom Django ERP with centralized server-side pricing and authenticated MCP endpoints, and a read-only integration path for an ERP database more than 20 years old; both modernization projects remain under active development.

Technologies: Python, Qt, Django, JavaScript, MCP, requirements discovery, business automation, system integration.

Full-Stack .NET Developer, Architecture Contributor **Jun 2024 - Present**
Honki Mode (Startup) *Kagawa, Japan*

- Designed analytics functionality for a tenant-aware POS administration platform using ClickHouse, RabbitMQ, Redis, and background recalculation segmented by tenant and time range; reduced selected update latency from approximately 1-2 minutes to 10-20 seconds.
- Designed a constrained JSON-to-SQL layer that validates frontend-defined analytical queries and translates them into ClickHouse SQL without accepting arbitrary client SQL.
- Implemented background CSV exports of approximately 300 MB across multiple services using pagination, batching, progress reporting, streaming generation, and direct upload to Amazon S3 while keeping memory usage bounded.
- Added reuse of previously generated exports and then resolved the resulting freshness trade-off by allowing users to choose between an existing file and explicit regeneration.
- Implemented an application layer around AWS Cognito using access tokens, refresh tokens, and application cookies to maintain session consistency and token renewal behavior.
- Contributed to an infrastructure review based on observed CPU and memory utilization. Consolidating workloads onto two EC2 worker nodes in the existing EKS environment reduced estimated recurring AWS cost by approximately $1,300 per month relative to the original infrastructure estimate; also introduced log and backup rotation policies.
- Proposed a project-specific versioned RabbitMQ contract approach and reviewed service boundaries, recommending consolidation when independent deployment did not justify additional operational complexity.
- Built a PDF and barcode-processing workflow that preserved document geometry and print scale, reduced the operational requirement from two employees to one, and cut manual processing time by more than half to approximately three hours or less.

Technologies: C#, .NET / ASP.NET Core, PostgreSQL, ClickHouse, Redis, RabbitMQ, AWS S3, Cognito, EC2, EKS, CloudWatch, React, TypeScript, Python, Qt, Django, MCP.

Professional Experience (continued)

Backend Developer **Feb 2023 - May 2024**
Devox Software *Poland / Remote*

- Developed backend functionality for a UK university-admission platform that supported multi-university applications, document verification, multiple services, and external integrations.
- Created an internal library for dynamic model mapping and OpenAPI / Swagger documentation, reducing duplication between backend and frontend models and supporting generation of frontend API clients from current service contracts.
- Delivered REST APIs, microservices, and platform integrations in an AWS-backed environment.

Technologies: C#, ASP.NET Core, microservices, REST, Swagger / OpenAPI, AWS EC2, S3, Lambda, CloudWatch.

.NET Full-Stack Developer **Dec 2022 - Jan 2023**
CyverIO (Contract) *Remote*

- Delivered backend and frontend functionality for a penetration-testing management platform using ASP.NET Core and Angular in a high-velocity product environment.
- Participated in architecture and refactoring discussions while balancing rapid feature delivery with the maintainability cost of accumulated technical debt.

Technologies: C#, ASP.NET Core, Angular, REST APIs.

Desktop WPF Developer **Dec 2021 - Oct 2022**
Motorola Solutions *Krakow, Poland*

- Maintained a mission-critical Windows application used by mobile and patrol units across more than 40 U.S. counties, working on defect resolution, refactoring, performance, and L2 / L3 production support in an ITIL / ITSM and SLA-oriented environment.
- Diagnosed defects across a large, highly coupled legacy codebase, including a responsive-layout failure caused by an upstream configuration module that reapplied a fixed width after the layout engine recalculated the UI.
- Worked with Windows permissions, inter-process communication, mapping integrations, dynamically configured UI components, and production operational data.
- Contributed in an enterprise quality environment using Azure Pipelines and a regression suite of more than 3,000 tests.

Technologies: C#, .NET, WPF, Windows integration, Azure Pipelines, automated testing.

Backend Developer (Part-Time / Freelance) **Apr 2022 - Sep 2022**
Whimsy Games *Remote*

- Developed backend and administration functionality for management of player data, game parameters, and operational game services.
- Implemented server APIs and contributed to the authentication and request-validation flow, keeping validation lightweight enough to avoid becoming an avoidable scaling bottleneck.
- Used Redis and MongoDB for fast access to operational player and game data in an AWS / Unity-oriented product environment.

Technologies: C#, .NET, REST APIs, Redis, MongoDB, game backend and administration systems.

C# Developer **Feb 2020 - Oct 2021**
Sollers Consulting *Lublin, Poland*

- Customized Moody's CreditLens for banking clients, delivering SQL-based reports and customer-specific enterprise functionality.
- Reworked and optimized reporting queries, introduced caching and parallel retrieval where appropriate, and improved selected reporting workflows by approximately 30-40%.
- Clarified requirements directly with a Moody's manager and delivered internal technical knowledge-sharing sessions.

Technologies: C#, .NET, SQL Server, SQL, enterprise banking software.

Selected Projects

SchoolAI *Creator, Full-Stack Developer, Product and Architecture Designer*
school-ai.jp

- Designed a serverless .NET 8 backend on AWS Lambda with API Gateway, Cognito, RDS, SQS FIFO queues, a dead-letter queue, worker Lambdas, WebSocket endpoints, and DynamoDB connection state.
- Integrated AWS Bedrock for model inference and used Parameter Store for configuration and secrets; built the React / TypeScript frontend with TanStack Query, Zustand, Tailwind CSS, TipTap, and i18next.
- Separated asynchronous AI jobs from interactive workflows and used real-time WebSocket delivery for job updates.

Technologies: C#, .NET 8, AWS Lambda, API Gateway, Cognito, RDS, SQS, DynamoDB, WebSockets, AWS Bedrock, React, TypeScript.

Orionyx Online *Creator, Lead Developer, System Designer*
orionyx.online

- Designed and implemented a browser-based real-time space MMO strategy game with configurable universes, progression systems, fleets, combat, alliances, trade, quests, rankings, and administration tooling.
- Built a monorepo architecture using a React SPA, HTTP and Socket.IO communication, an Express API, PostgreSQL, and Redis.
- Current implementation includes approximately 55 database tables, 37 REST route files, around 40 business-logic services, more than 30 game pages, and 19 administration pages.

Technologies: React 19, TypeScript, Vite, Node.js, Express, PostgreSQL 16, Drizzle ORM, Redis 7, Socket.IO, JWT, Zod, Vitest, Docker.

Selected Contract Engineering

Insurance Automation Platform *Contract Automation Developer*
Reliability, observability, concurrent processing

- Designed a worker-based platform that processed up to 10 insurance applications concurrently through independent Selenium automation flows backed by a database queue.
- Made external-site failures diagnosable by recording structured logs, application context, and screenshots at the point of failure while isolating each worker from unrelated jobs.

Technologies: C#, .NET, Selenium, SQL, concurrent processing, structured diagnostics.

Scientific Desktop Application *Contract Desktop Software Developer*
High-frequency visualization and hardware integration

- Built a non-invasive behavioral-research application integrating National Instruments hardware and MATLAB-based workflows.
- Implemented a dedicated rendering thread and synchronized multi-source visualization above 60 FPS without blocking the user interface; also delivered log inspection and experiment-diagnostics functionality.

Technologies: C#, .NET desktop, multithreading, National Instruments, MATLAB integration.

Education

Master of Science in Computer Science, Zhejiang Normal University, China 2024
Bachelor of Science in Computer Science, Lublin University of Technology, Poland 2020
Bachelor of Science in Computer Engineering, Chernihiv National University of Technology, Ukraine 2018

Languages, Certification & Training

Languages: Ukrainian (Native), Russian (Native), Polish (Upper Intermediate), English (Upper Intermediate), Japanese (N4).

Certification: AWS Certified AI Practitioner - Amazon Web Services (issued Sep 2026; valid through Sep 2029). Validation number: 71b1cf7a8f3b46c38dbb059d9de003b7.

Selected training: Claude Code in Action - Anthropic (Apr 2026); 5-Day AI Agents Intensive - Kaggle / Google (Dec 2025); AWS Cloud Quest: Generative AI Practitioner - AWS Training & Certification (Nov 2025); C# ASP.NET Core - OTUS, 156 academic hours (Jun 2023).
